
How to avoid this in the future

- ▶ Namespace is the most common issue: write `dplyr::mutate()` rather than `mutate()`. Especially when mixing BioC and tidyverse.
- ▶ Always think about how to use `testthat` to check the correctness of the functions on the spot, not at the end before you package is about to be submitted.
- ▶ Read Hadley's books or consult your friend (aka Mark/Weichang) on C++.
- ▶ Don't build your package in a Dropbox folder.
