R CMD check

▸ "Build" a package is cheap.

▸ "Check" a package is a much higher standard.

▸ Everyone must pass this check before being put on CRAN or BioC.

   ▸ Error: the worst of all. [dum dum dum]

   ▸ Warning: less severe, but also prevents pass.

   ▸ Note: You should check these, but *no worries, she'll be right [Australian accent].*

▸ Hadley (and thus, I) recommends devtools::check() instead, but it is not quite the same.

▸ Also consider devtools::release_check().
